

Operator Discovery Report: perturbation_escape_two_cluster_stagnation

- Operator type: perturbation.
- Host scaffold: nearest_neighbor_2opt.
- Core idea: Deterministic perturbation schedule for stagnation: escalate between targeted segment reversals and double-bridge style reconnections; more aggressive on longer stagnation streaks to escape bottleneck/two-cluster traps w
- Novelty classification: stagnation_escalator.
- Rediscovery signature: perturbation:segment_reversal:double_bridge:3:3.
- Surviving candidate: False.
- Problem class where it helps: none confirmed.

Pseudocode

- Track stagnation count during local search and restarts.
- Use segment_reversal by default and escalate toward double_bridge after the stagnation threshold.
- Increase perturbation strength deterministically when escape pressure rises.

Complexity

- Non-empty lines: 12.
- Complexity score: 0.44.
- Fingerprint: 22b5aa9af4d578da.

Why It Should Help

- The operator targets local-minimum escape directly by controlling when and how restarts are perturbed.

Failure Cases

- Does not transplant cleanly into clustered_local_search.
- No validation family shows a clear improvement over the host baseline.
- Disabling the operator does not hurt, so the ablation does not support a real operator effect.
