

Operator Discovery Report: rank_candidates_mix_geo_bottleneck

- Operator type: candidate_ranker.
- Host scaffold: nearest_neighbor_2opt.
- Core idea: Deterministic local-search candidate move ranker that biases toward 2-opt edge crossings and long-edge fixes while reducing traps; tuned to transfer across bottleneck/two-cluster and mixed EUC-2D instances.
- Novelty classification: delta_weighted_ranker.
- Rediscovery signature: candidate_ranker:delta=1.250,cross=1.000,span=0.200,trap=0.600.
- Surviving candidate: False.
- Problem class where it helps: none confirmed.

Pseudocode

- For each candidate move, compute a composite score from immediate delta, crossing removal, span, trap awareness, and local structure.
- Sort candidate moves by ascending composite score.
- Apply the first move that yields a genuine tour improvement.

Complexity

- Non-empty lines: 13.
- Complexity score: 0.46.
- Fingerprint: 44c99bc352a57fe0.

Why It Should Help

- The operator changes which local-search moves are tried first, so it can improve search efficiency without rewriting the underlying solver.

Failure Cases

- Underperforms on grid_like_tsp with gap delta 0.054436.
- Does not transplant cleanly into nearest_neighbor_2opt.
- Does not transplant cleanly into random_restart_2opt.
- No validation family shows a clear improvement over the host baseline.
- Disabling the operator does not hurt, so the ablation does not support a real operator effect.
