

Operator Discovery Report: two_stage_restart_controller_transfer

- Operator type: restart_controller.
- Host scaffold: nearest_neighbor_2opt.
- Core idea: Deterministically increases restart budget under 2-opt stagnation, using perturbation-based restarts to escape two-cluster bottlenecks and clustered EUC2D traps while keeping restart growth controlled for dense/grid-like
- Novelty classification: adaptive_restart_controller.
- Rediscovery signature: restart_controller:2:8:2.
- Surviving candidate: False.
- Problem class where it helps: clustered_tsp, two_cluster_bottleneck_tsp.

Pseudocode

- Start from a conservative restart budget.
- Increase restart count only after the configured stagnation trigger.
- Keep perturbation restarts bounded by a deterministic maximum.

Complexity

- Non-empty lines: 12.
- Complexity score: 0.44.
- Fingerprint: 429c3751789f7e53.

Why It Should Help

- The operator changes restart pressure under stagnation, which is a compact way to regulate exploration without rewriting search internals.

Failure Cases

- Does not transplant cleanly into sparse_three_opt.
- Does not transplant cleanly into clustered_local_search.
- Runtime inflation is high at 0.881022.
