

Operator Discovery Report: perturb_escape_deterministic_double_bridge_v2

- Operator type: perturbation.
- Host scaffold: nearest_neighbor_2opt.
- Core idea: Deterministic stagnation escape using a two-stage double-bridge style perturbation sequence biased toward breaking long inter-cluster links typical in two-cluster bottlenecks and grid-like layouts.
- Novelty classification: stagnation_escalator.
- Rediscovery signature: perturbation:double_bridge:segment_reversal:3:3.
- Surviving candidate: False.
- Problem class where it helps: none confirmed.

Pseudocode

- Track stagnation count during local search and restarts.
- Use double_bridge by default and escalate toward segment_reversal after the stagnation threshold.
- Increase perturbation strength deterministically when escape pressure rises.

Complexity

- Non-empty lines: 12.
- Complexity score: 0.44.
- Fingerprint: d6961015653cac70.

Why It Should Help

- The operator targets local-minimum escape directly by controlling when and how restarts are perturbed.

Failure Cases

- Does not transplant cleanly into clustered_local_search.
- No validation family shows a clear improvement over the host baseline.
- Disabling the operator does not hurt, so the ablation does not support a real operator effect.
