

Operator Discovery Report: perturbation_deterministic_double_bridge_escape

- Operator type: perturbation.
- Host scaffold: nearest_neighbor_2opt.
- Core idea: Deterministic perturbation to escape 2-opt stagnation using a double-bridge primary move, escalating with a secondary segment reversal and a bounded window shuffle when repeated stagnation persists.
- Novelty classification: deterministic_perturbation_schedule.
- Rediscovery signature: perturbation:double_bridge:segment_reversal:2:3.
- Surviving candidate: False.
- Problem class where it helps: none confirmed.

Pseudocode

- Track stagnation count during local search and restarts.
- Use double_bridge by default and escalate toward segment_reversal after the stagnation threshold.
- Increase perturbation strength deterministically when escape pressure rises.

Complexity

- Non-empty lines: 12.
- Complexity score: 0.44.
- Fingerprint: 7f8eabbbe557f815.

Why It Should Help

- The operator targets local-minimum escape directly by controlling when and how restarts are perturbed.

Failure Cases

- Does not transplant cleanly into clustered_local_search.
- No validation family shows a clear improvement over the host baseline.
- Disabling the operator does not hurt, so the ablation does not support a real operator effect.
