

Operator Discovery Report: candidate_pruner_transfer_adaptive_local_trap_guard

- Operator type: candidate_pruner.
- Host scaffold: nearest_neighbor_2opt.
- Core idea: Deterministically adapts local-search candidate-list size using instance descriptors, pruning more aggressively on easy/clustered cases while keeping more candidates for bottleneck/two-cluster and grid-like structures to
- Novelty classification: descriptor_adaptive_pruner.
- Rediscovery signature: candidate_pruner:18:3:2:2.
- Surviving candidate: False.
- Problem class where it helps: none confirmed.

Pseudocode

- Start from a base candidate-list size.
- Expand or shrink the list using instance descriptors such as size, trap score, grid-likeness, clustering, and current stagnation.
- Run the downstream local search only on the resulting pruned neighborhood.

Complexity

- Non-empty lines: 12.
- Complexity score: 0.44.
- Fingerprint: e37efb0280351232.

Why It Should Help

- The operator adapts neighborhood size to instance structure, which can trade off search breadth and runtime in a reusable way.

Failure Cases

- Does not transplant cleanly into clustered_local_search.
- No validation family shows a clear improvement over the host baseline.
- Disabling the operator does not hurt, so the ablation does not support a real operator effect.
