

Operator Discovery Report: transfer_restart_controller_bottleneck_escape_2opt

- Operator type: restart_controller.
- Host scaffold: nearest_neighbor_2opt.
- Core idea: Deterministic restart growth that triggers early under stagnation (tighter for trap-prone layouts) and uses perturbation on restarts; keeps restart budget moderate to preserve transfer across grid/mixed instances.
- Novelty classification: adaptive_restart_controller.
- Rediscovery signature: restart_controller:2:6:1.
- Surviving candidate: False.
- Problem class where it helps: two_cluster_bottleneck_tsp.

Pseudocode

- Start from a conservative restart budget.
- Increase restart count only after the configured stagnation trigger.
- Keep perturbation restarts bounded by a deterministic maximum.

Complexity

- Non-empty lines: 12.
- Complexity score: 0.44.
- Fingerprint: 0fbd8de1c2b96f47.

Why It Should Help

- The operator changes restart pressure under stagnation, which is a compact way to regulate exploration without rewriting search internals.

Failure Cases

- Does not transplant cleanly into sparse_three_opt.
- Does not transplant cleanly into clustered_local_search.
- Runtime inflation is high at 0.821431.
