

Operator Discovery Report: cp_adaptive_limit_transfer_pruner

- Operator type: candidate_pruner.
- Host scaffold: nearest_neighbor_2opt.
- Core idea: Transfer-oriented candidate pruning: adaptively reduces local-search move-list size on harder clustered/grid-like instances while keeping more candidates on two-cluster-bottleneck/elongated layouts to avoid premature sta
- Novelty classification: trap_expanding_pruner.
- Rediscovery signature: candidate_pruner:18:6:5:7.
- Surviving candidate: False.
- Problem class where it helps: none confirmed.

Pseudocode

- Start from a base candidate-list size.
- Expand or shrink the list using instance descriptors such as size, trap score, grid-likeness, clustering, and current stagnation.
- Run the downstream local search only on the resulting pruned neighborhood.

Complexity

- Non-empty lines: 12.
- Complexity score: 0.44.
- Fingerprint: 7684af082792f648.

Why It Should Help

- The operator adapts neighborhood size to instance structure, which can trade off search breadth and runtime in a reusable way.

Failure Cases

- Does not transplant cleanly into clustered_local_search.
- No validation family shows a clear improvement over the host baseline.
- Disabling the operator does not hurt, so the ablation does not support a real operator effect.
- Runtime inflation is high at 0.384599.
