

Full Research Suite Runbook

This runbook executes the full stricter research plan from scratch.

It covers:

1. 3 repeated core-suite runs
2. 3 repeated ablation-suite runs
3. 1 controls run
4. 1 cheating-opportunity run
5. aggregate report generation

Total from scratch: 3800 epochs.

Preparation

Install the required Python packages into the interpreter you plan to use:

```
python -m pip install -r requirements.txt
```

Each `run_suite.py` execution prints a final line of the form:

```
Completed suite. Results written to: <run_dir>
```

Record that `<run_dir>` value after every step. You will need those paths for the aggregate commands at the end.

Execute The Suite

Run these commands in order.

1. Core Suite A

```
python run_suite.py --config configs\full_suite\01_core_a.json
```

2. Core Suite B

```
python run_suite.py --config configs\full_suite\02_core_b.json
```

3. Core Suite C

```
python run_suite.py --config configs\full_suite\03_core_c.json
```

4. Ablation Suite A

```
python run_suite.py --config configs\full_suite\04_ablations_a.json
```

5. Ablation Suite B

```
python run_suite.py --config configs\full_suite\05_ablations_b.json
```

6. Ablation Suite C

```
python run_suite.py --config configs\full_suite\06_ablations_c.json
```

7. Controls Suite

```
python run_suite.py --config configs\full_suite\07_controls.json
```

8. Cheating-Opportunity Suite

```
python run_suite.py --config configs\full_suite\08_cheating_opportunity.json
```

Aggregate Reports

Replace the placeholder run directories below with the actual run_... directories printed by the suite commands.

Core Aggregate

```
python aggregate_runs.py --run-dir <core_run_a_dir> --run-dir <core_run_b_dir> --run-dir <core_run_c_dir>
--output-dir runs\aggregate_full_suite_core
```

Ablation Aggregate

```
python aggregate_runs.py --run-dir <ablation_run_a_dir> --run-dir <ablation_run_b_dir> --run-dir
<ablation_run_c_dir> --output-dir runs\aggregate_full_suite_ablations
```

Full-Campaign Aggregate

This report is useful for a campaign-level artifact inventory, but causal interpretation should still rely mainly on the separate core and ablation aggregates.

```
python aggregate_runs.py --run-dir <core_run_a_dir> --run-dir <core_run_b_dir> --run-dir <core_run_c_dir>
--run-dir <ablation_run_a_dir> --run-dir <ablation_run_b_dir> --run-dir <ablation_run_c_dir> --run-dir
<controls_run_dir> --run-dir <cheating_run_dir> --output-dir runs\aggregate_full_suite_all
```

If you reuse a run, substitute it for its correspondent suite config. E.g., <core_run_X_dir> .

Produced Artifacts

Each run writes:

- suite_summary.json
- run_metadata.json
- report.md
- report.pdf
- per-condition scores.svg
- per-condition scores.png

Each aggregate command writes:

- aggregate_summary.json
- aggregate_report.md
- aggregate_report.pdf
- aggregate chart PNGs
